

# TRIECA | 2017 CONFERENCE

## Thank you to all of our 2017 sponsors:

### Media Partners

### Hosts

# **When Creek Meets Valley Wall: Prioritizing Erosion Mitigation alongside the Oshawa Landfill**

**Robin McKillop<sup>1</sup>, Dan McParland<sup>1</sup> & Cassie Scobie<sup>2</sup>**

**TRIECA conference**

**March 22-23, 2017**

<sup>1</sup> Palmer Environmental Consulting Group Inc.

<sup>2</sup> Regional Municipality of Durham

**PALMER**  
ENVIRONMENTAL  
CONSULTING  
GROUP INC.

# Outline

- Background
- Assessment approach
- Erosion site inventory
- Prioritization and design of mitigation

A sepia-toned photograph of a riverbank. The foreground is dominated by a dense, tangled mass of exposed tree roots hanging down from the bank. A large, thick log lies horizontally across the middle ground, partially submerged in the water. The background shows more trees and foliage, slightly out of focus. The overall tone is historical and naturalistic.

# **BACKGROUND**

# Oshawa Landfill

- Operational from 1960s until 1979
- Located in former sand/gravel pit
- Capped in 1980; now just site of transfer station

# Oshawa Landfill

# Durham's role

- Responsible for monitoring and maintenance since closure in 1979
  - Ensure continued protection of surrounding natural environment
- Durham/CLOCA identified local instabilities and seepage areas along Oshawa Creek and tributary
  - Seepage inventory
  - Isolated seepage mitigation and erosion protection works (“Green Wall”)
- Recognized need to inventory, assess and mitigate erosion risks...

A sepia-toned photograph of a riverbank. The foreground is dominated by a dense, tangled mass of exposed tree roots hanging down from the bank. A large, thick log lies horizontally across the middle ground, partially submerged in the water. The background shows more trees and foliage along the opposite bank. The overall tone is historical and naturalistic.

# **ASSESSMENT APPROACH**

# Objective

- To conduct an **integrated fluvial and slope erosion assessment** alongside the Oshawa Landfill as a basis for **inventorying, prioritizing and mitigating erosion sites** determined to pose long-term risk to integrity of landfill perimeter

# Channel-valley wall interaction

# Procedure

## 1. Background review

- Surficial geology mapping, borehole logs, groundwater data
- Historical and recent aerial photography
- Reach delineation

# Geological setting

From: CH2MHILL (2013)

# Procedure

## 1. Background review

- Surficial geology mapping, borehole logs, groundwater data
- Historical and recent aerial photography
- Reach delineation

## 2. Reach-scale field reconnaissance

- Fluvial processes focus, modes of adjustment, erosion site identification, channel stability assessment

## 3. Site-specific investigations

- Examination and characterization of contributory failure mechanisms (e.g. seepage/undercutting)
- Measurement of failure geometry

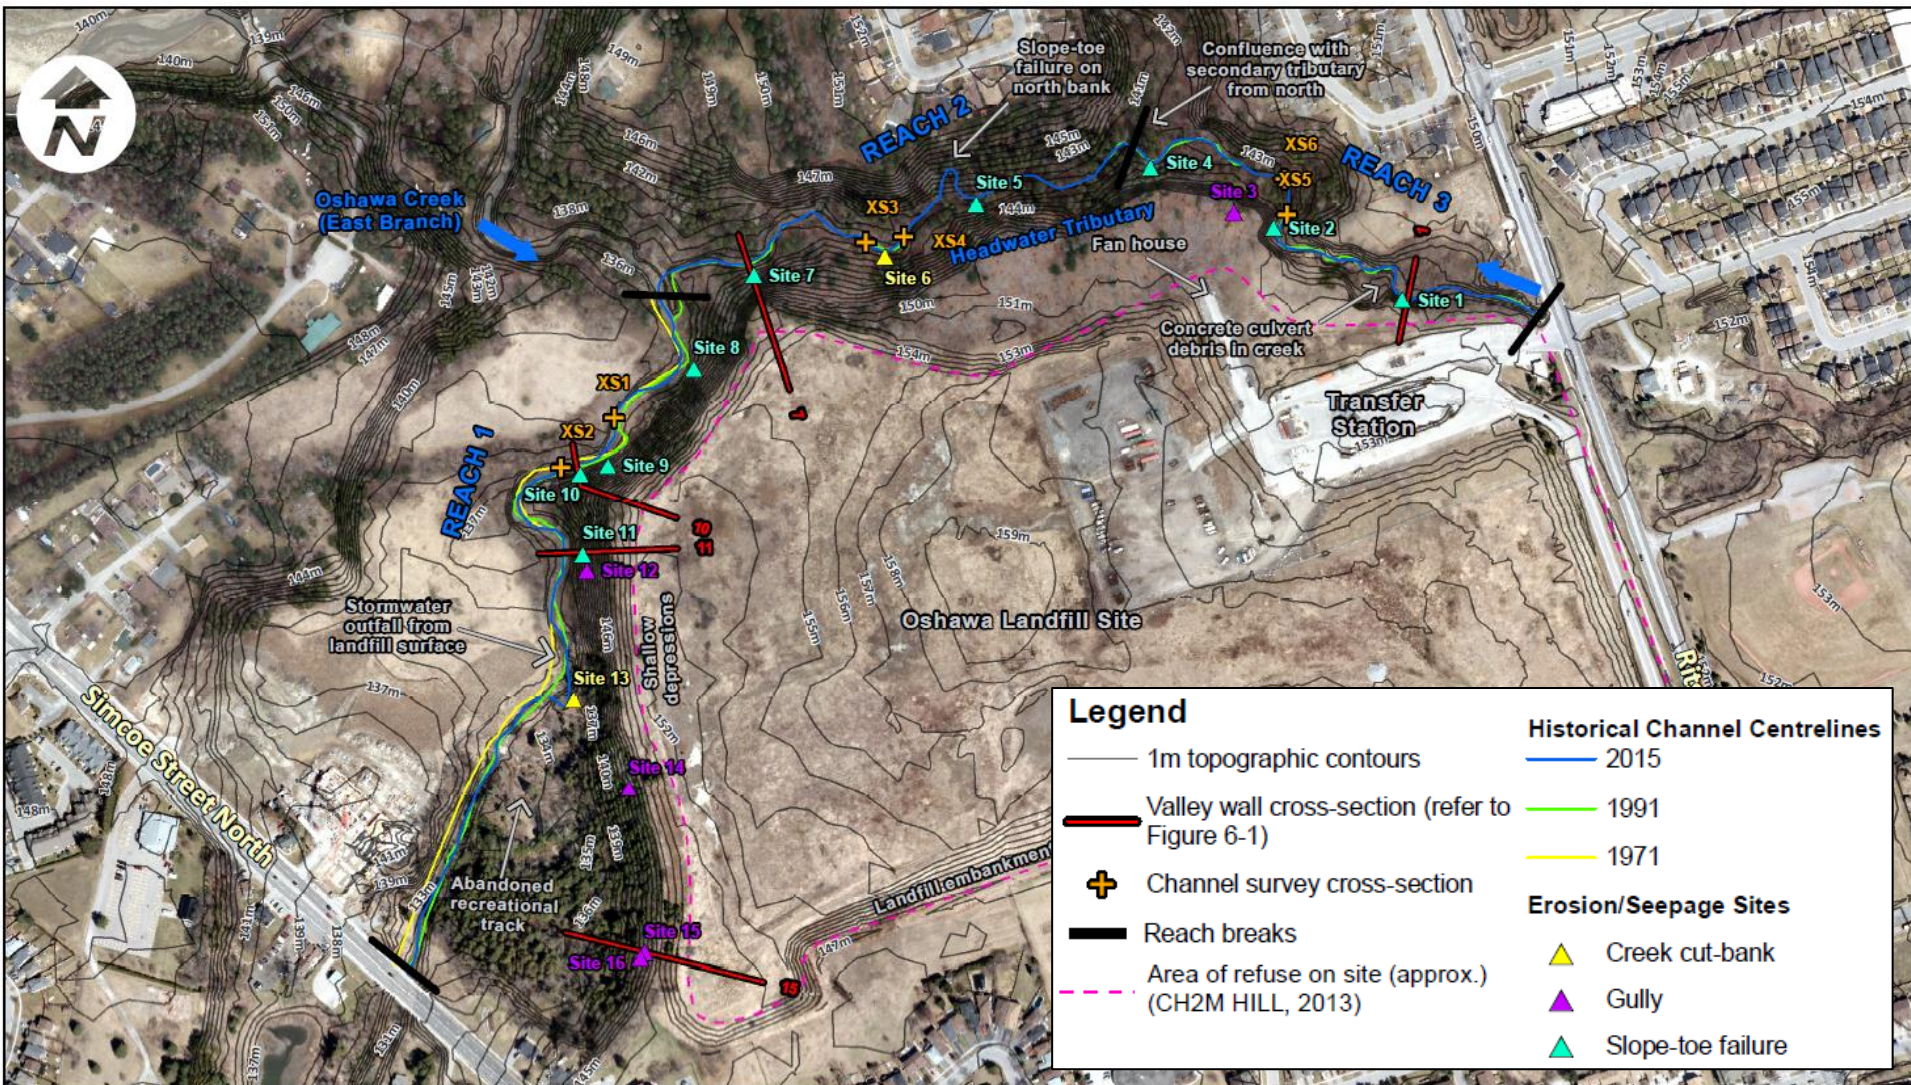

The background image shows a natural scene of a riverbank. On the left, a steep bank is covered with dense vegetation, including many thin, light-colored roots hanging down towards the water. A large, thick, fallen tree trunk lies horizontally across the middle ground, partially submerged in the water. The water appears calm and slightly murky. In the background, more trees and foliage are visible, creating a dense forest setting. The overall tone is somewhat muted, with a lot of browns, greys, and muted greens.

# **EROSION SITE INVENTORY**

# Erosion site inventory

# Erosion site inventory

- 16 sites, representing three forms of instability
  - 2 creek cut-banks 
  - 9 slope-toe failures 
  - 5 gullies 
- Principal drivers of instability
  - Channel down-cutting and migration
  - Groundwater seepage and piping of fine sediments
  - Uncontrolled surface runoff

**Erosion = lateral + vertical**

## SITE CHARACTERISTICS

### Type

Toe-slope failure

### Proximity to approx. refuse limit (m)

13

### Property

Region

### Material

Interbedded outwash sand/gravel

### Seepage influence

Moderate [Seep B (i), (ii)]

### Watercourse Reach

3 - Headwater Tributary (Upper)

### Bankfull channel dimensions (m)

3.7 (W) & 0.9 (D)

## Description

Undercutting of the toe of the valley wall, along the outer bank of a meander, has led to shallow slumping within interbedded glaciofluvial sands and gravels underlain by laminated glaciolacustrine silt. Groundwater seeps from the bank at the contact between the glaciofluvial and glaciolacustrine sediments. Without intervention, continued erosion of the valley wall may pose a risk to landfill embankment stability.

# Site-specific data summaries

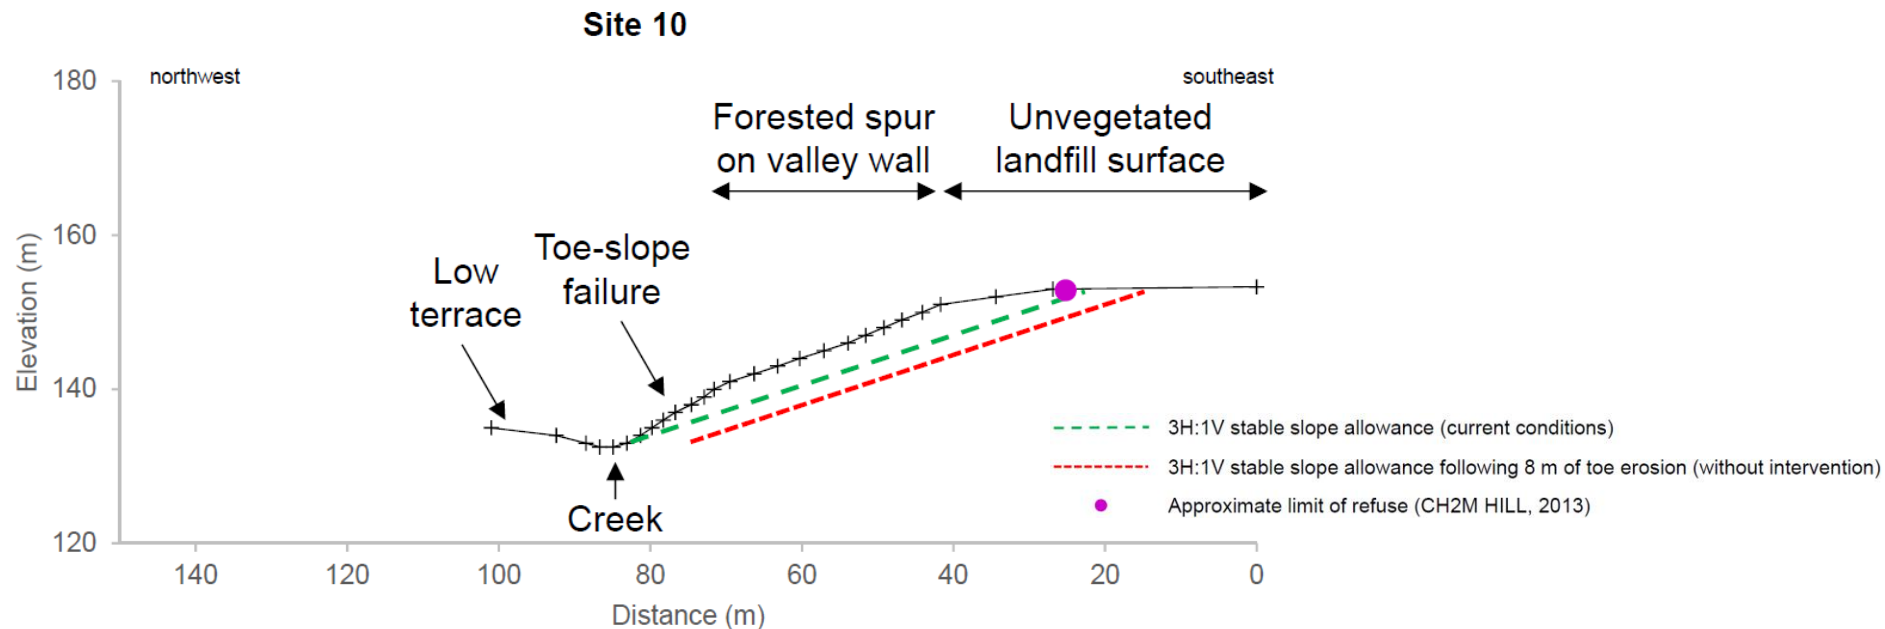

# **PRIORITIZATION AND DESIGN OF MITIGATION**

# Basis for prioritization

- Proximity to refuse limit
- Severity of slope erosion
- Valley wall cross-sectional geometry

**SITE 1**

**SITE 7**

## **5 high-priority sites**

**SITE 10**

**SITE 11**

**SITE 15**

# Design criteria

- Ensure long-term stability of valley wall surrounding landfill
  - Arrest existing erosion
  - Avoid exacerbating or triggering new erosion (as consequence of mitigative works)
- Minimize impacts to, or enhance, aquatic and riparian ecosystems

# Evaluation of alternatives

- 3 alternatives per site + 'do nothing'

- Evaluation criteria

– In-stream and floodplain hydraulics

– Fluvial processes and slope erosion

– Valley wall seepage and aesthetics

– Ecological sensitivities

– Environmental permitting requirements

– Capital and maintenance costs

Criteria	Alternative 1 - Do Nothing	Alternative 2 - The Bridge-Tie and Minor Channel Shift	Alternative 3 - Channel Realignment to the North	Alternative 4 - Channel Realignment with Modified Planform
In-stream and Floodplain Hydraulics	<ul style="list-style-type: none"> <li>The channel would continue to maintain connection to the floodplain resulting in relatively high flow speeds being maintained within the channel.</li> <li>Some degree of channel migration would be expected.</li> </ul>	<ul style="list-style-type: none"> <li>Most risk of increasing a strong flood hydro due to bed raising.</li> <li>Fluvial processes would be altered due to the channel shift and the resulting changes in flow patterns would increase flood risk.</li> </ul>	<ul style="list-style-type: none"> <li>Most risk of increasing a strong flood hydro due to bed raising.</li> <li>Fluvial processes would be altered due to the channel shift and the resulting changes in flow patterns would increase flood risk.</li> </ul>	<ul style="list-style-type: none"> <li>Most risk of increasing a strong flood hydro due to bed raising.</li> <li>Fluvial processes would be altered due to the channel shift and the resulting changes in flow patterns would increase flood risk.</li> </ul>
Score	2	3	3	3
Valley Wall Seepage and Aesthetics	<ul style="list-style-type: none"> <li>The channel would continue to maintain connection to the floodplain resulting in relatively high flow speeds being maintained within the channel.</li> <li>Some degree of channel migration would be expected.</li> </ul>	<ul style="list-style-type: none"> <li>Most risk of increasing a strong flood hydro due to bed raising.</li> <li>Fluvial processes would be altered due to the channel shift and the resulting changes in flow patterns would increase flood risk.</li> </ul>	<ul style="list-style-type: none"> <li>Most risk of increasing a strong flood hydro due to bed raising.</li> <li>Fluvial processes would be altered due to the channel shift and the resulting changes in flow patterns would increase flood risk.</li> </ul>	<ul style="list-style-type: none"> <li>Most risk of increasing a strong flood hydro due to bed raising.</li> <li>Fluvial processes would be altered due to the channel shift and the resulting changes in flow patterns would increase flood risk.</li> </ul>
Score	2	3	3	3
Ecological Sensitivity	<ul style="list-style-type: none"> <li>The channel would continue to maintain connection to the floodplain resulting in relatively high flow speeds being maintained within the channel.</li> <li>Some degree of channel migration would be expected.</li> </ul>	<ul style="list-style-type: none"> <li>Most risk of increasing a strong flood hydro due to bed raising.</li> <li>Fluvial processes would be altered due to the channel shift and the resulting changes in flow patterns would increase flood risk.</li> </ul>	<ul style="list-style-type: none"> <li>Most risk of increasing a strong flood hydro due to bed raising.</li> <li>Fluvial processes would be altered due to the channel shift and the resulting changes in flow patterns would increase flood risk.</li> </ul>	<ul style="list-style-type: none"> <li>Most risk of increasing a strong flood hydro due to bed raising.</li> <li>Fluvial processes would be altered due to the channel shift and the resulting changes in flow patterns would increase flood risk.</li> </ul>
Score	2	3	3	3
Environmental Permitting Requirements	<ul style="list-style-type: none"> <li>The channel would continue to maintain connection to the floodplain resulting in relatively high flow speeds being maintained within the channel.</li> <li>Some degree of channel migration would be expected.</li> </ul>	<ul style="list-style-type: none"> <li>Most risk of increasing a strong flood hydro due to bed raising.</li> <li>Fluvial processes would be altered due to the channel shift and the resulting changes in flow patterns would increase flood risk.</li> </ul>	<ul style="list-style-type: none"> <li>Most risk of increasing a strong flood hydro due to bed raising.</li> <li>Fluvial processes would be altered due to the channel shift and the resulting changes in flow patterns would increase flood risk.</li> </ul>	<ul style="list-style-type: none"> <li>Most risk of increasing a strong flood hydro due to bed raising.</li> <li>Fluvial processes would be altered due to the channel shift and the resulting changes in flow patterns would increase flood risk.</li> </ul>

Best Option	1	2 (Preferred)	3	4

# Communication with CLOCA

- Early engagement (study approach)

- Key findings and report available

- Detailed and simplified evaluation tables

- Concept plans → detailed designs

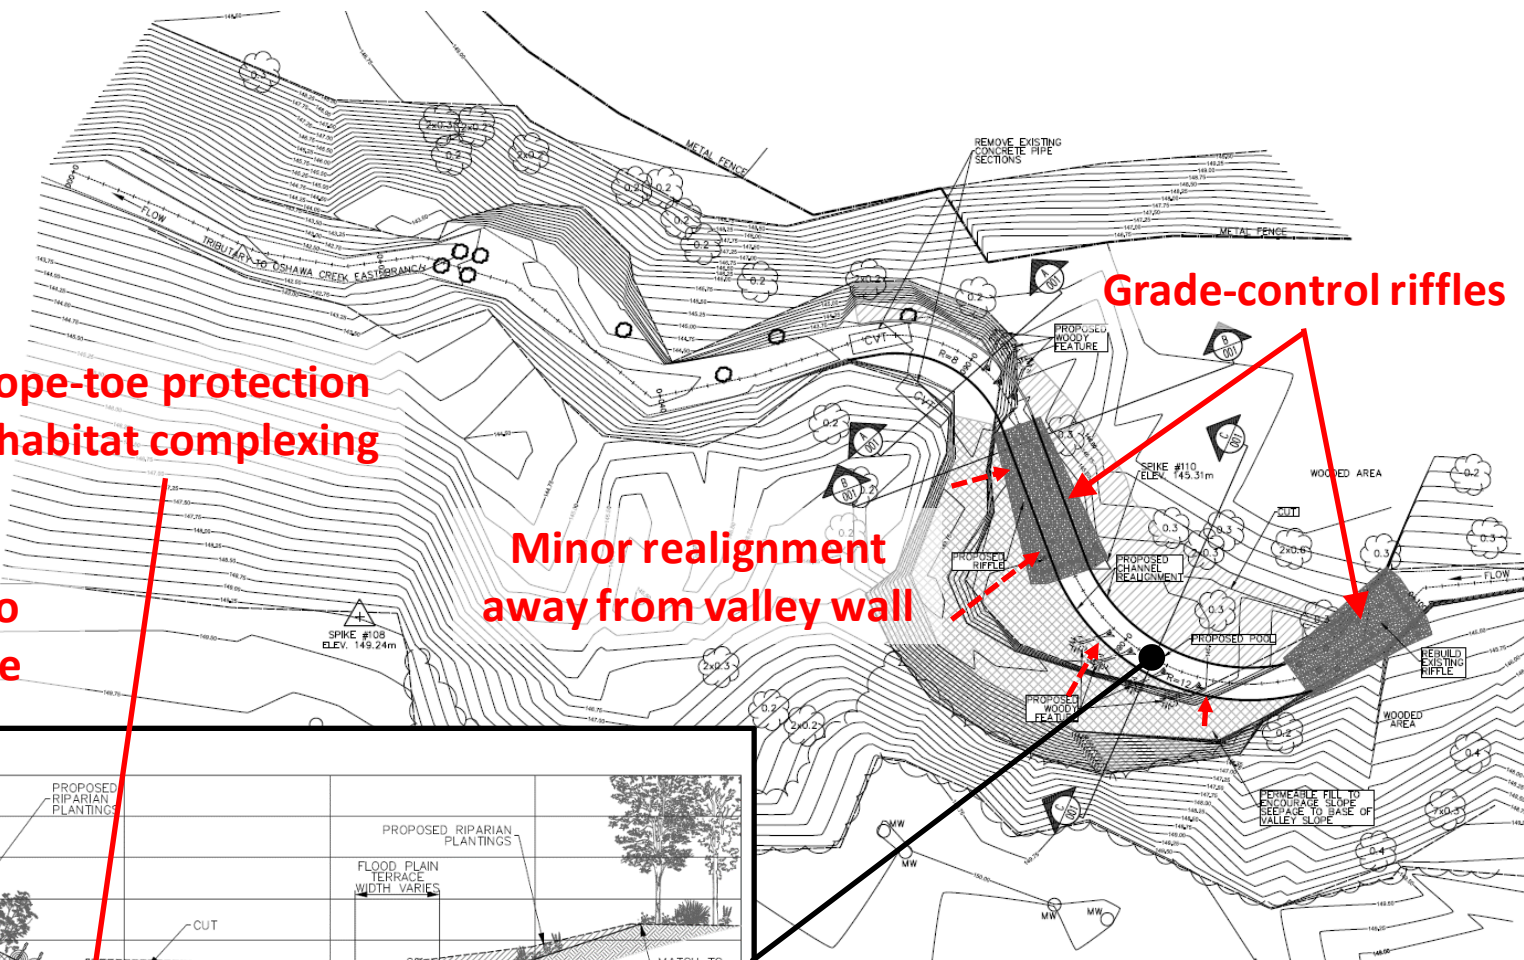

PALMER  
ENVIRONMENTAL  
CONSULTING  
GROUP INC.

Greck

# Site 1 – concept plan

Drainage stone to intercept seepage

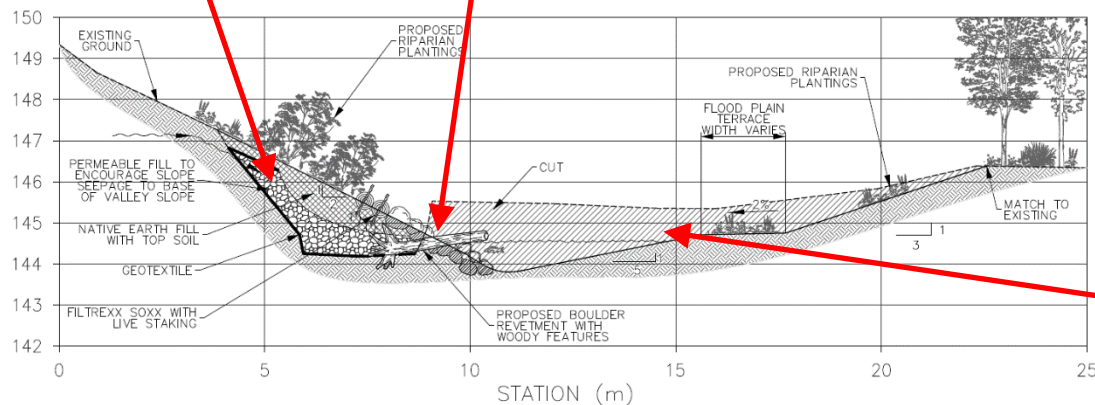

Slope-toe protection & habitat complexing

Minor realignment away from valley wall

Grade-control riffles

Compensatory cut along inner bank

SECTION C-C

## Next steps

- Detailed design, permitting & tendering
  - Underway
- Implementation
  - Summer 2017 construction – Sites 1, 10 & 11?
  - Summer 2018 – Sites 7 & 15?
- Construction supervision
